

# LiftBlok™

40kg Hi-vis plastic coated concrete ballast blocks with integral carry handles.

**LiftBlok™** is another revolutionary ballast block designed specifically for use with temporary fencing systems.

Once again, the unique design provides a professional, safe, and consistent solution to avoiding precarious and unreliable ballast being used to stabilise temporary fencing such as bags of sand (can easily split and lose weight), concrete slabs (trip hazard and break easily), additional fence feet (trip hazard) and other makeshift solutions.

LiftBlocs are concrete filled and plastic coated to provide 40kg of kentledge per unit with minimal risk of breakage. Integral carry handles enable the block to be easily hand-lifted and positioned by two persons.

The units are stackable, adding more weight and security, when required, to suit the project or environment.

Brightly coloured in yellow, LiftBlocs are highly visible, helping to identify the fence line and reducing risk of trips.

The **LiftBlok™** is fully compatible with our range of temporary fence bracing systems.
