

PedBlok™

15kg Plastic coated concrete ballast blocks for use on pedestrian/crowd control barriers.

Dimensions:
307mm x
440mm

PedBlok™ is another revolutionary ballast block designed specifically for use with pedestrian barriers and pedestrian barrier gates.

A unique, V-shaped design provides a professional, safe, and consistent solution, avoiding precarious and unreliable ballast being used to stabilise crowd control barriers such as bags of sand (unattractive and can easily split and lose weight) and other makeshift solutions.

PedBlocs are concrete filled and plastic coated to provide 15kg of kentledge per unit with minimal risk of breakage. The block is designed to be easily hand-lifted and positioned by a single person.

Two blocks can be used on each barrier, adding more weight and security, to suit the project or environment.

Brightly coloured in red, PedBlocs are highly visible, helping to identify the fence line and reducing the risk of trips.
